

Figure 3-11 Example of a Geologic Transect (Profile WE-03, Elevation and length units in feet).

Most of the geologic boreholes are located in the south-central and southeastern part of the model area while only scarce information from a few USGS boreholes are available in the northern parts. The northern part is however not the key area and the lack of geologic information is therefore not considered critical for the model performance in the key areas around Lake Toho and Lake Alligator.
